```

Advances in annotation technology have not kept pace with genome sequencing, and annotation is now the major bottleneck affecting modern genomics research.

MAKER

an annotation pipeline and genome-database management tool for second-generation genome projects

Easy-to-use by design

Easy-to-use by design

User	Can be run by a single individual with little bioinformatics
Requirements:	experience

Easy-to-use by design

User	Can be run by a single individual with little bioinformatics
Requirements:	experience
System	Can run on laptop or desktop computers (running Linux or
Requirements:	Mac OS X)

Easy-to-use by design

User	Can be run by a single individual with little bioinformatics
Requirements:	experience
System	Can run on laptop or desktop computers (running Linux or
Requirements:	Mac OS X)
	Output is compatible with popular annotation tools like
Program Output:	Apollo and GBrowse

	Output is compatible with popular annotation tools like
Program Output:	Apollo and GBrowse
Availability:	Free open source application (for the academic community)

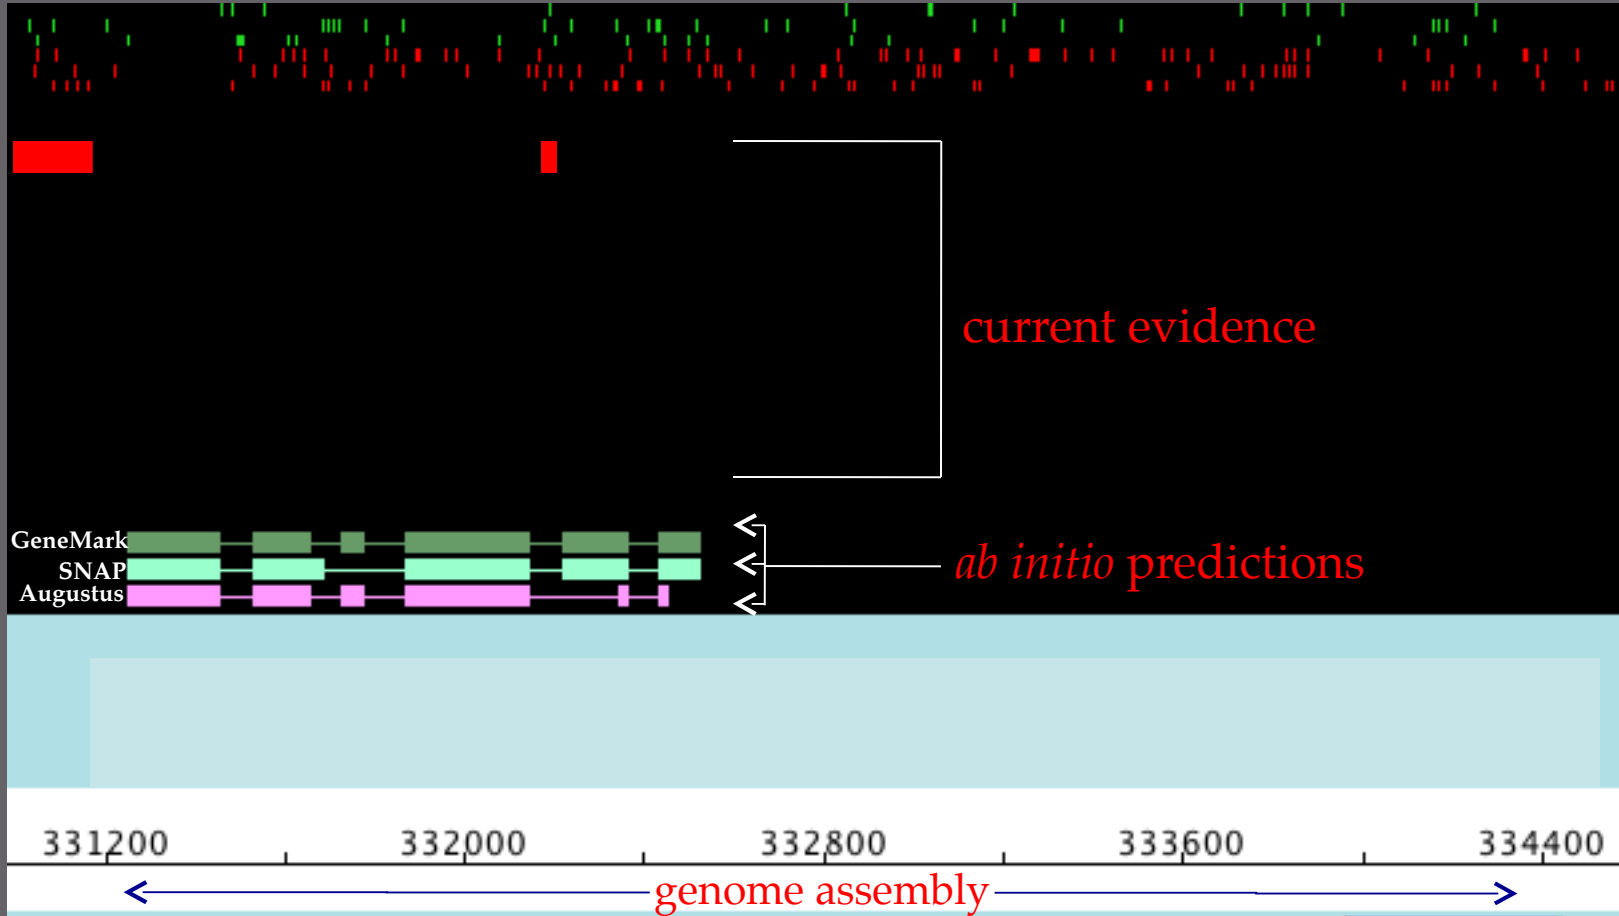

Annotating the Genome – Apollo View

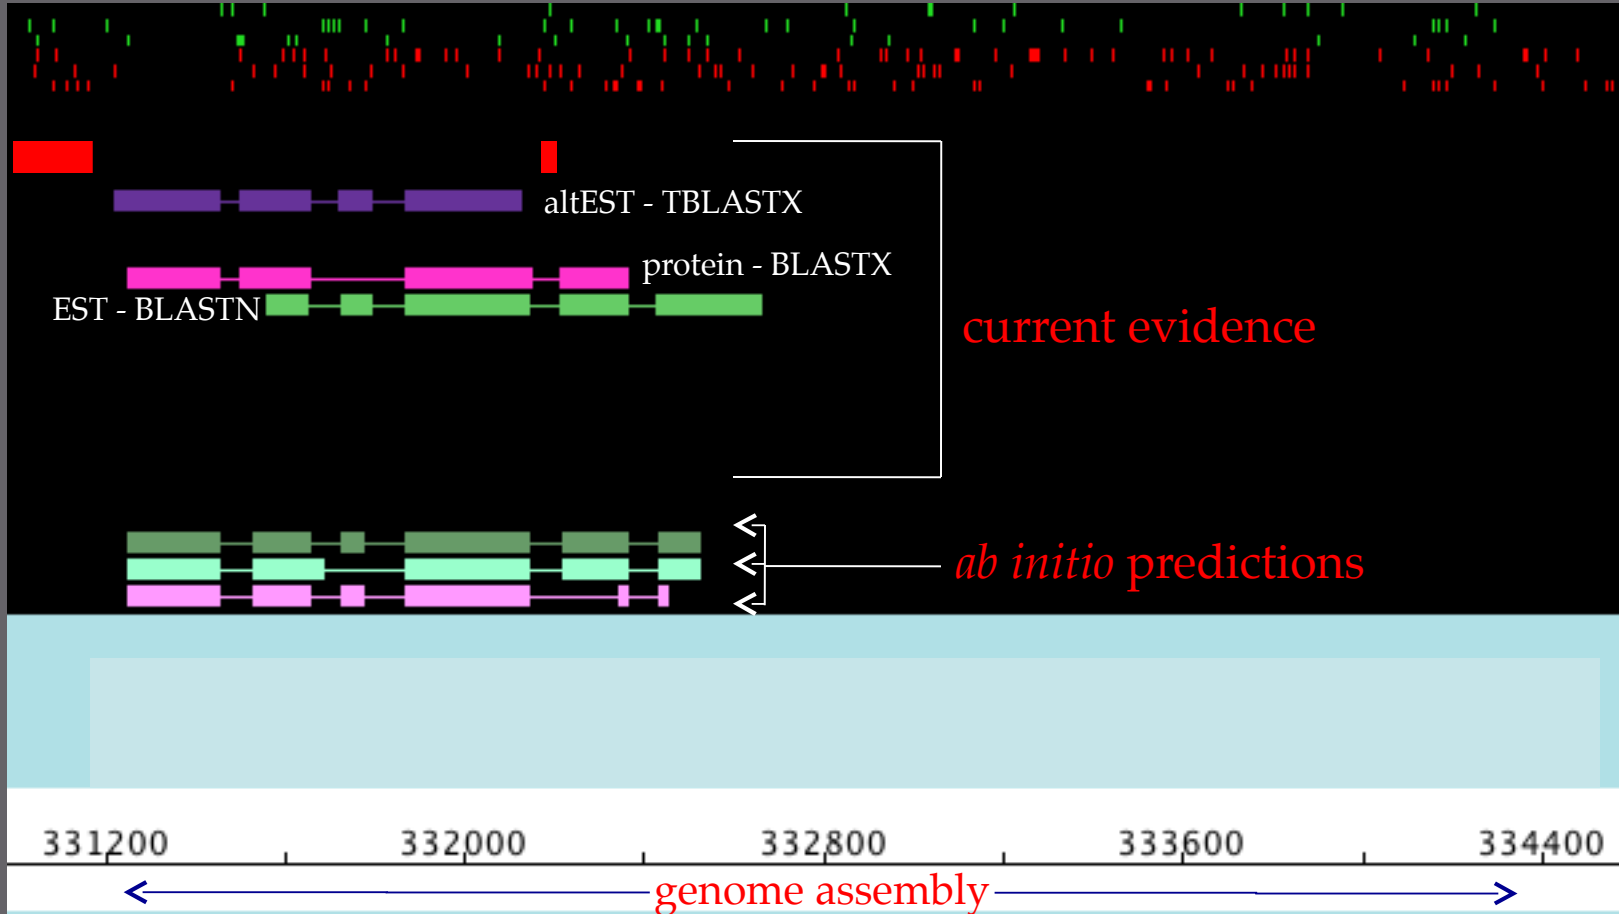

Identify and mask repetitive elements

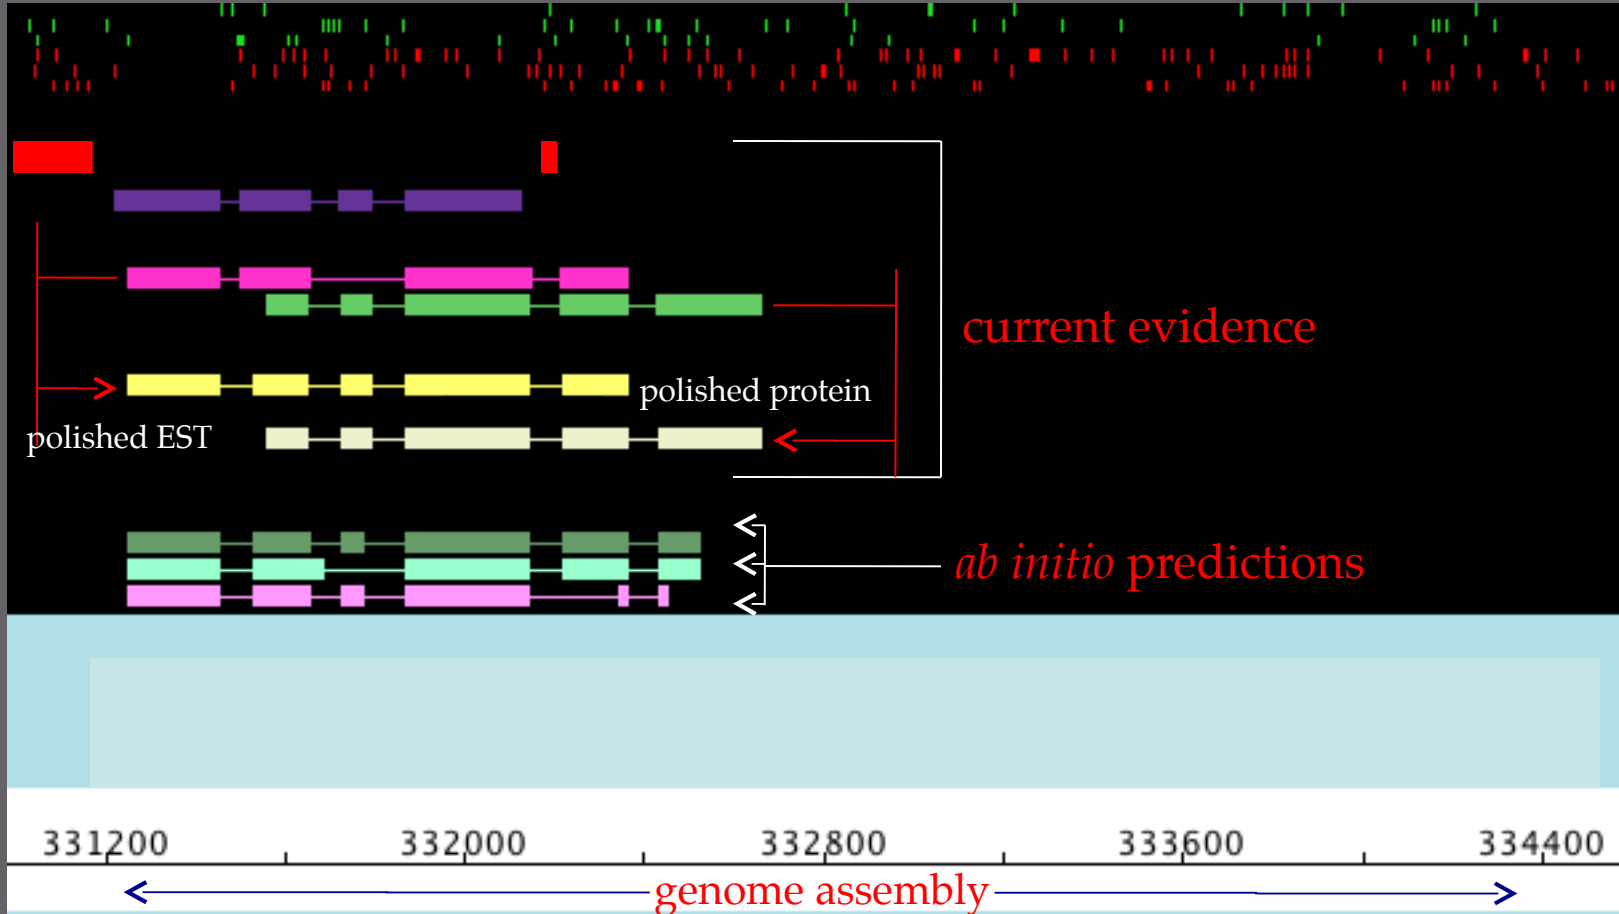

Generate *ab initio* gene predictions

Align EST and protein evidence

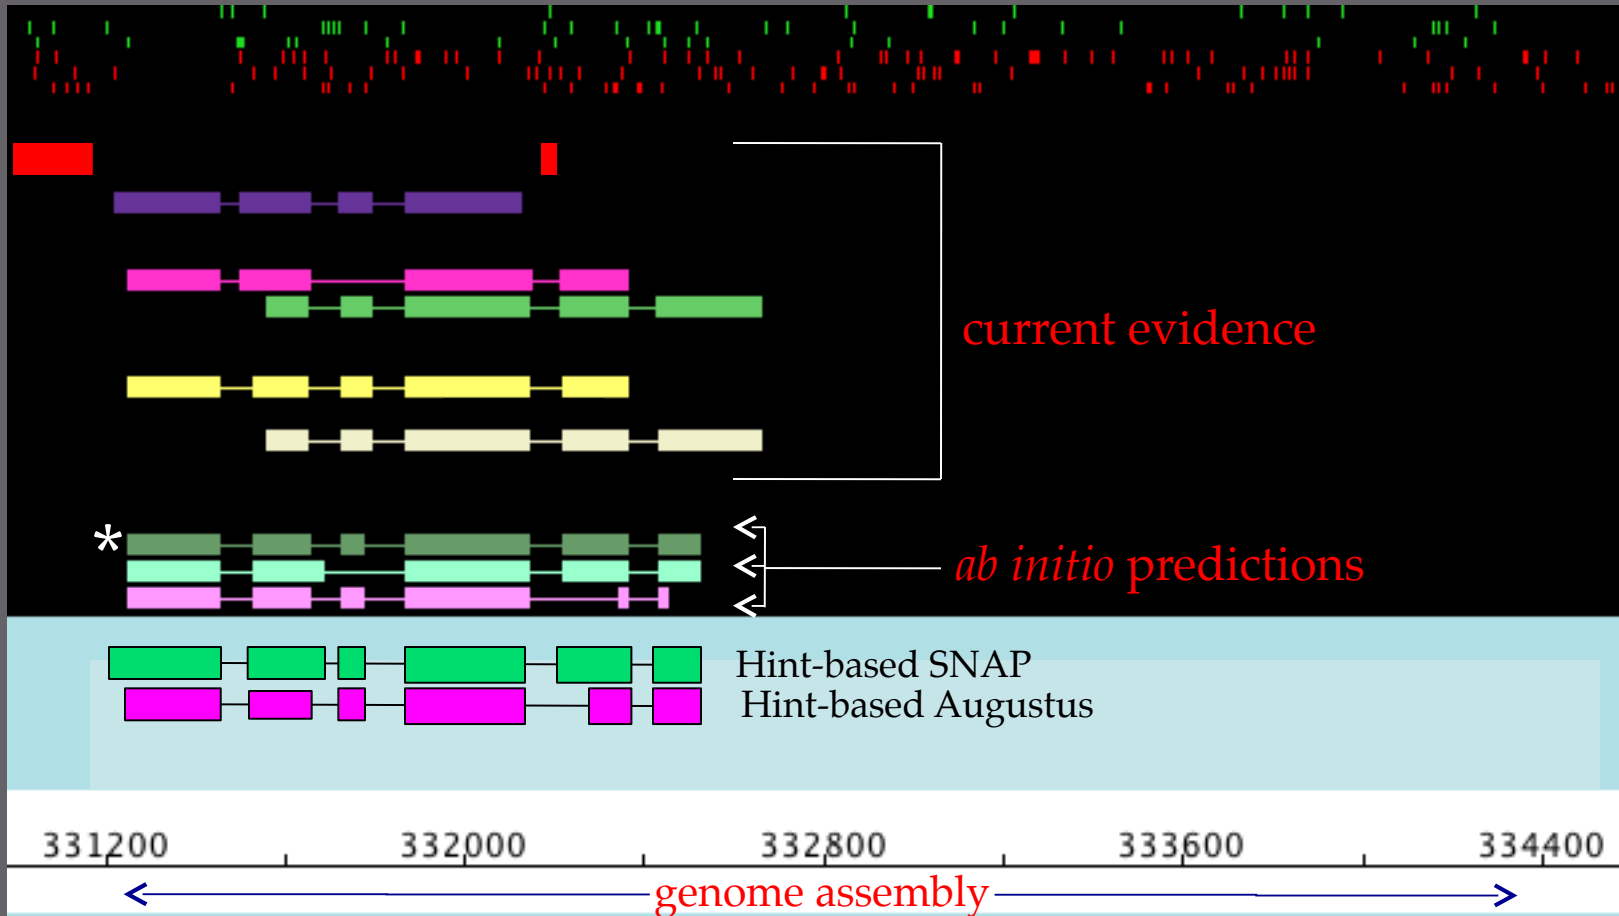

Polish BLAST alignments with Exonerate

Pass gene-finders evidence-based 'hints'

Identify gene model most consistent with evidence

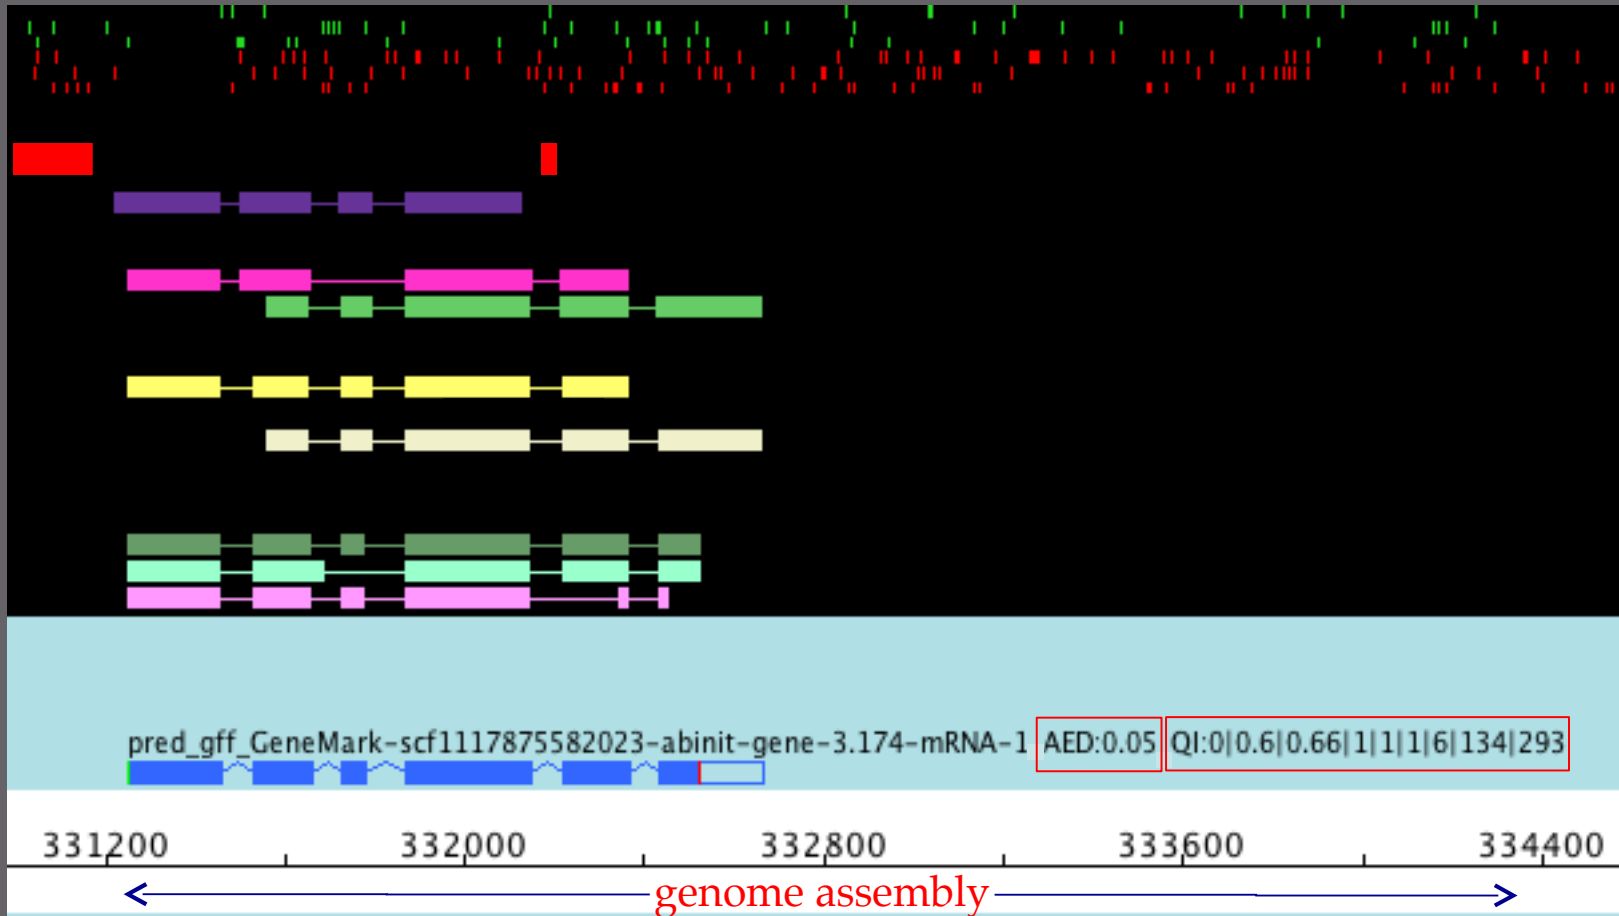

*Quantitative Measures for the Management and Comparison of Annotated Genomes
Karen Eilbeck , Barry Moore , Carson Holt and Mark Yandell BMC Bioinformatics 2009
10:67doi:10.1186/1471-2105-10-67

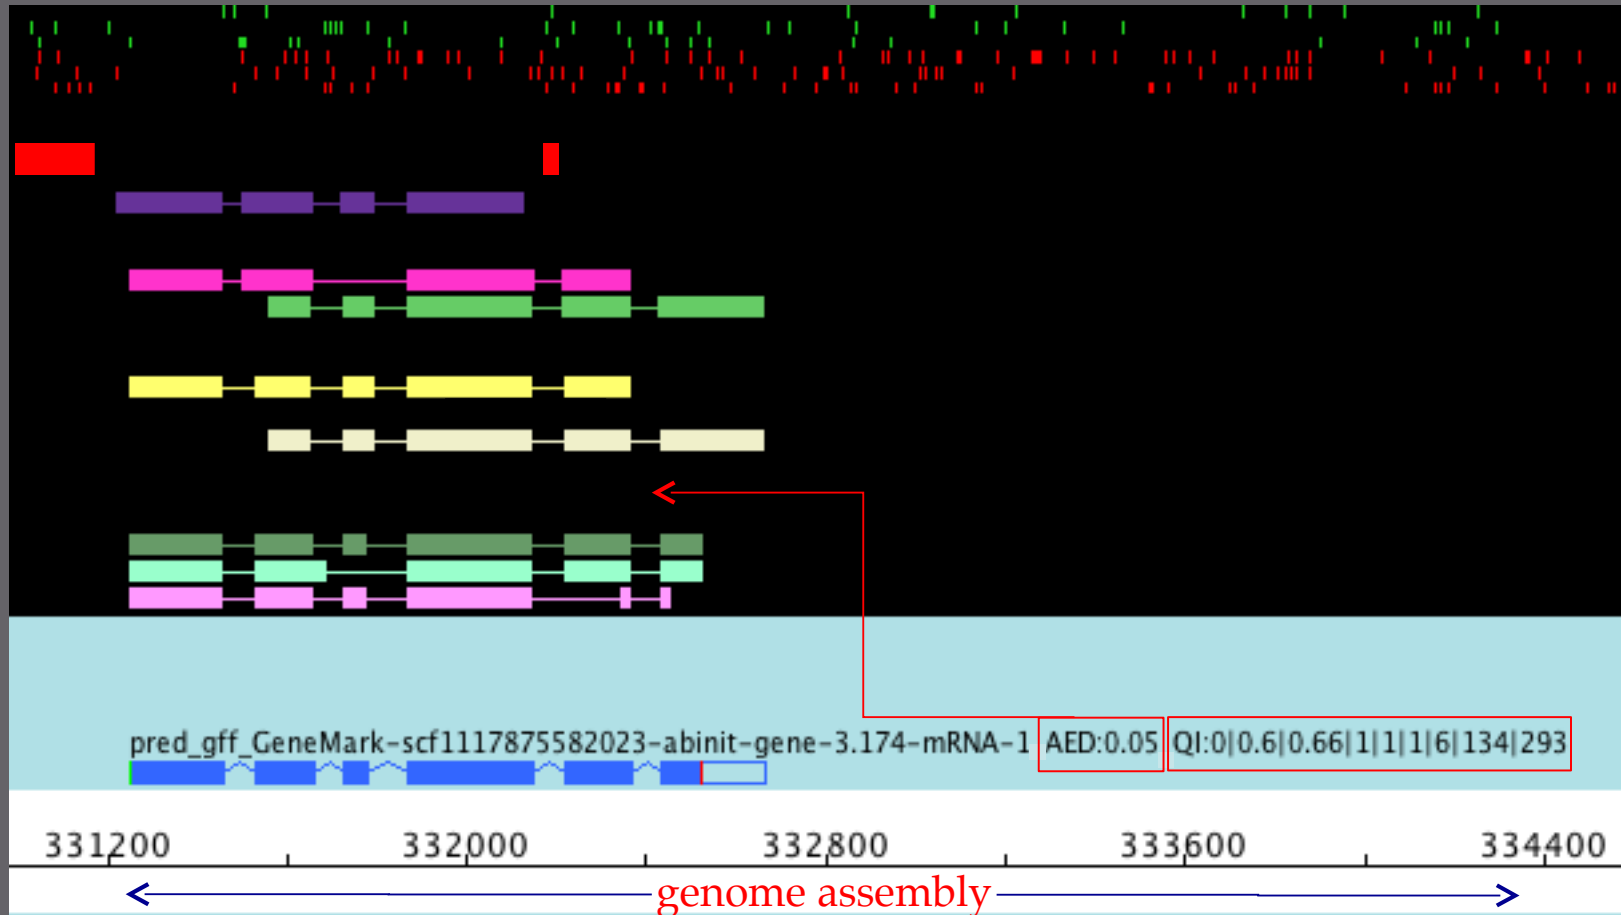

Revise it further if necessary; create new annotation

Compute support for each portion of gene model

Compute support for each portion of gene model

*Quantitative Measures for the Management and Comparison of Annotated Genomes
Karen Eilbeck , Barry Moore , Carson Holt and Mark Yandell BMC Bioinformatics 2009
10:67doi:10.1186/1471-2105-10-67

Compute support for each portion of gene model

*Cantarel BL, Korf I, Robb SMC, Parra G, Ross E, Moore B, Holt C, Sanchez Alvarado A, Yandell M: MAKER: An easy-to-use annotation pipeline designed for emerging model organism genomes. *Genome Res* 2008, 18:188-196.

Beyond *de novo* annotation

- Quality control and data prioritization

Beyond *de novo* annotation

- Quality control and data prioritization
- mRNA-seq integration
- Update/revise legacy annotation sets
- Integrating new evidence into existing databases

Beyond *de novo* annotation

Legacy Annotation Set 1

Legacy Annotation Set 2

Legacy Annotation Set n

Beyond *de novo* annotation

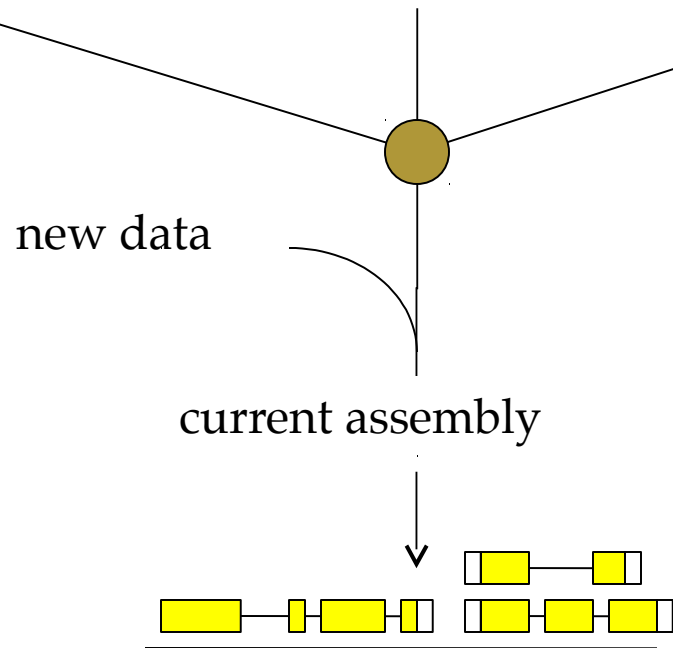

Legacy Annotation Set 1

Legacy Annotation Set 2

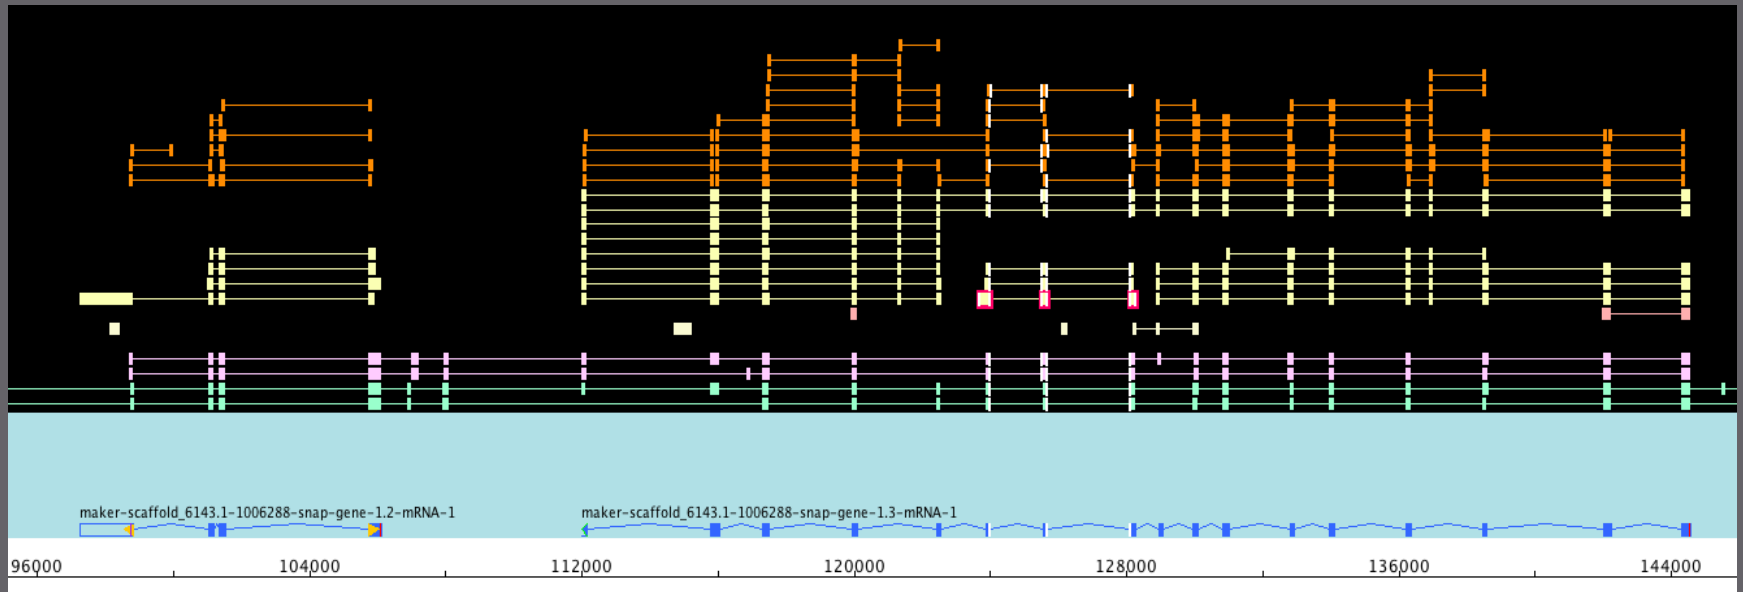

Legacy Annotation Set n

- Identify legacy annotation most consistent with new data
- Automatically revise it in light of new data
- If no existing annotation, create new one

mRNA-seq in MAKER

MAKER Web Annotation Service:

an online portal for genome annotation and analysis

MAKER Web Annotation Service

Your Genome Annotated

Welcome to the MAKER Web Annotation Service

Log into your account below, or you can access the server as a guest. While there is no login requirement for this site, users are highly encouraged to set up an account. Use the "New user registration" link to register a new account. Registration is free, and has several benefits. Registered users can submit up to 5,000,000 base pairs of sequence for each annotation job. Guest users are limited to 500,000 base pairs per annotation job submission. Registered users

Annotation Properties

These are other options that can have an effect on the annotation process. For the most part, you can leave these set to their default values.

Non standard amino acids generally cause problems for alignment algorithms. Here you can select a standard amino acids to replace non standard amino acids.

All contigs from the input genome file below this size will be skipped.

All final gene annotations must produce a protein of at least this many amino acids in length.

Expected maximum intron size for evidence alignments (in base pairs).

Consider single exon EST evidence when generating annotations. Single exon ESTs usually result from genomic contamination of the cDNA, so ignoring them is recommended.

Minimum length required for single exon ESTs if single exon EST alignments are used (see above option).

	MAKER Job Details	Assigned id: 1655
---	--------------------------	-------------------

Annotation Post Processing

Indicate the post processing you would like to perform on the annotations. You can add functional annotations such as putative gene functions, Gene Ontology terms, and protein domains to the gene models. You can also change long MAKER assigned names into shorter gene names.

<input checked="" type="checkbox"/>	Add putative gene functions via comparison to the UniProt/Swiss-Prot protein database	
<input checked="" type="checkbox"/>	Add protein domains and GO terms via InterProScan	
	Choose a prefix for making shorter gene names (blank to ignore)	<input type="text" value="GMOD_"/>

- Add Job to Queue
- Save/Come Back Later
- Clear

GMOD_00000004-RA Details

Name: GMOD_00000004-RA
Type: mRNA
Description: Similar to VAT1: Synaptic vesicle membrane protein VAT-1 homolog (Homo sapiens)
Source: maker
Position: [NT_010783.15:30454..38291 \(- strand\)](#)
Length: 7838
Alias: augustus_masked-NT_010783.15-abinit-gene-0.8-mRNA-1
Dbxref: Gene3D:G3DSA:3.40.50.720

InterPro:IPR002085

 InterPro:IPR016040
 InterPro:IPR020843
 PANTHER:PTHR11695
 PANTHER:PTHR11695:SF29
 Pfam:PF00107
 Pfam:PF08240
 Prosite:PS01162
 SMART:SM00829
 superfamily:SSF50129
 superfamily:SSF51735

Note: Similar to VAT1: Synaptic vesicle membrane protein VAT-1 homolog (Homo sapiens)
Ontology_term: GO:0003824
 GO:0005488
 GO:0008152
 GO:0008270
 GO:0016491
 GO:0055114

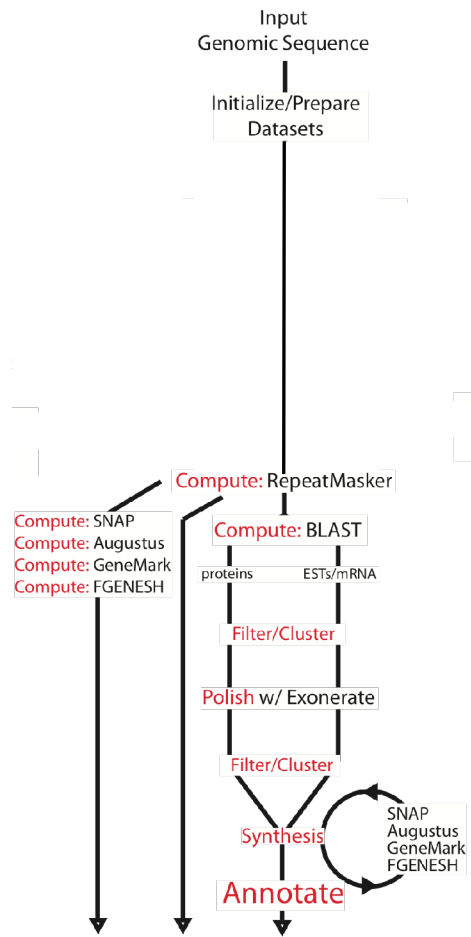

More MAKER Features

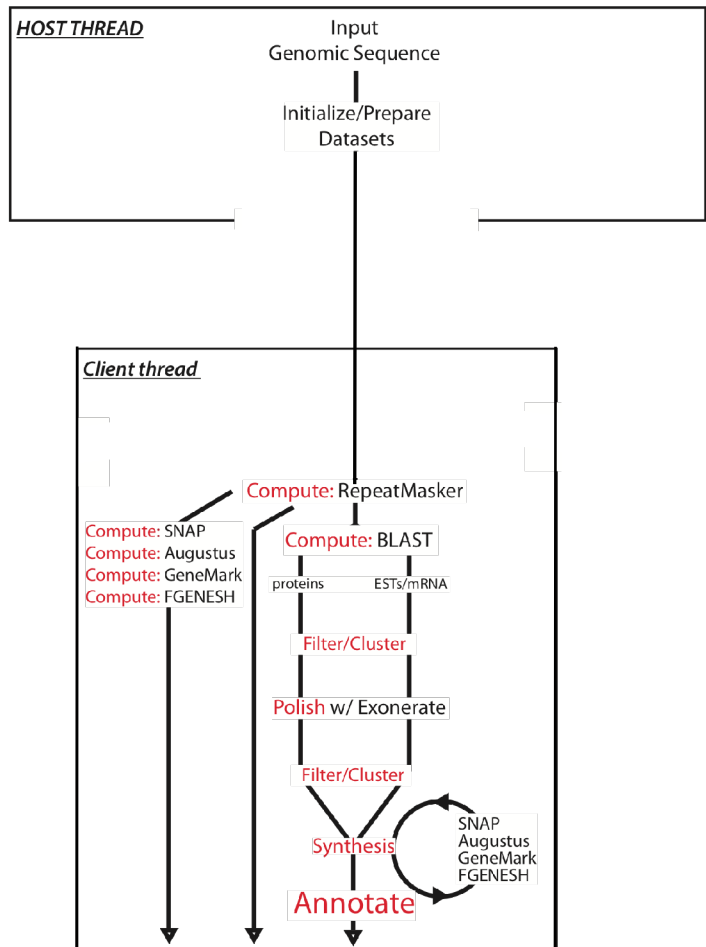

- Auto-training of SNAP
- Improved filtering of gene models
- Comma separated file lists and labels (“blastx:uniprot” or “blastx:hymenoptera”)
- Local install of MWAS
- Interactive install and configuration
- Easy GMOD integration (pre-loaded with configuration files and scripts - maker2chado and maker2jbrowse)

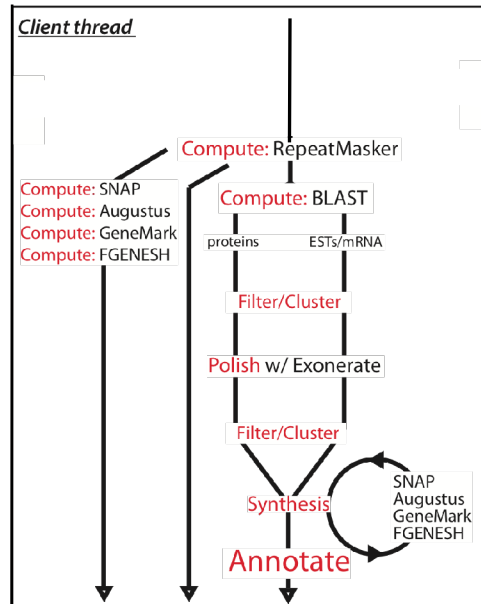

Distributed Parallelization

- Supports Message Passing Interface (MPI), a communication protocol for computer clusters which essentially allows multiple computers to act like a single powerful machine.

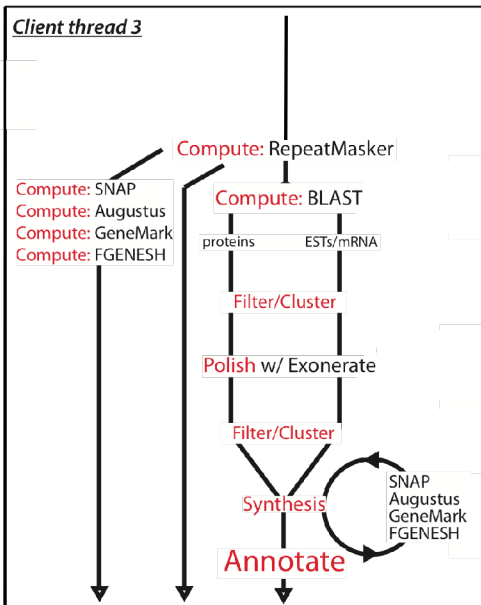

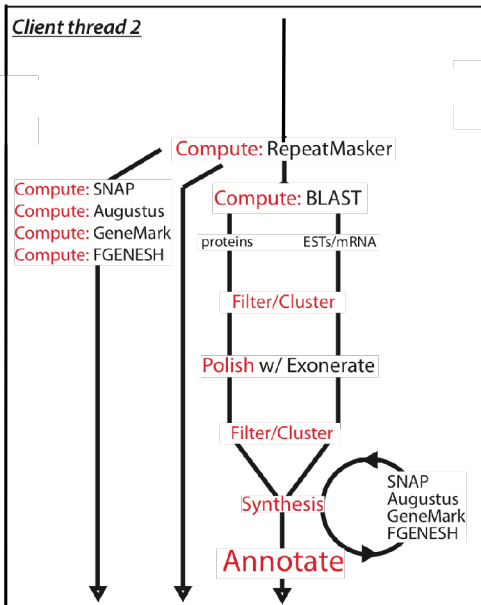

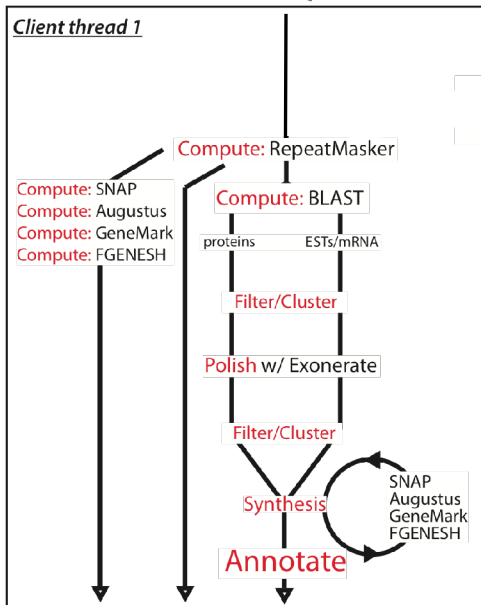

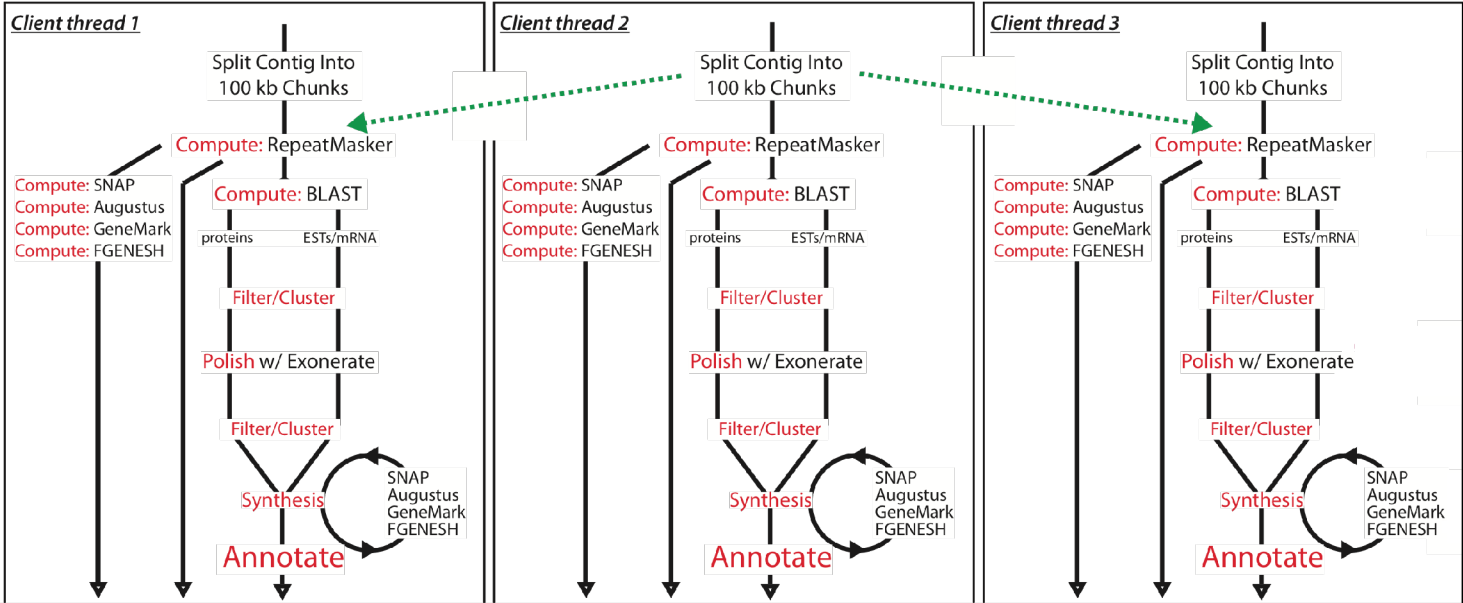

..... Contig level parallelization

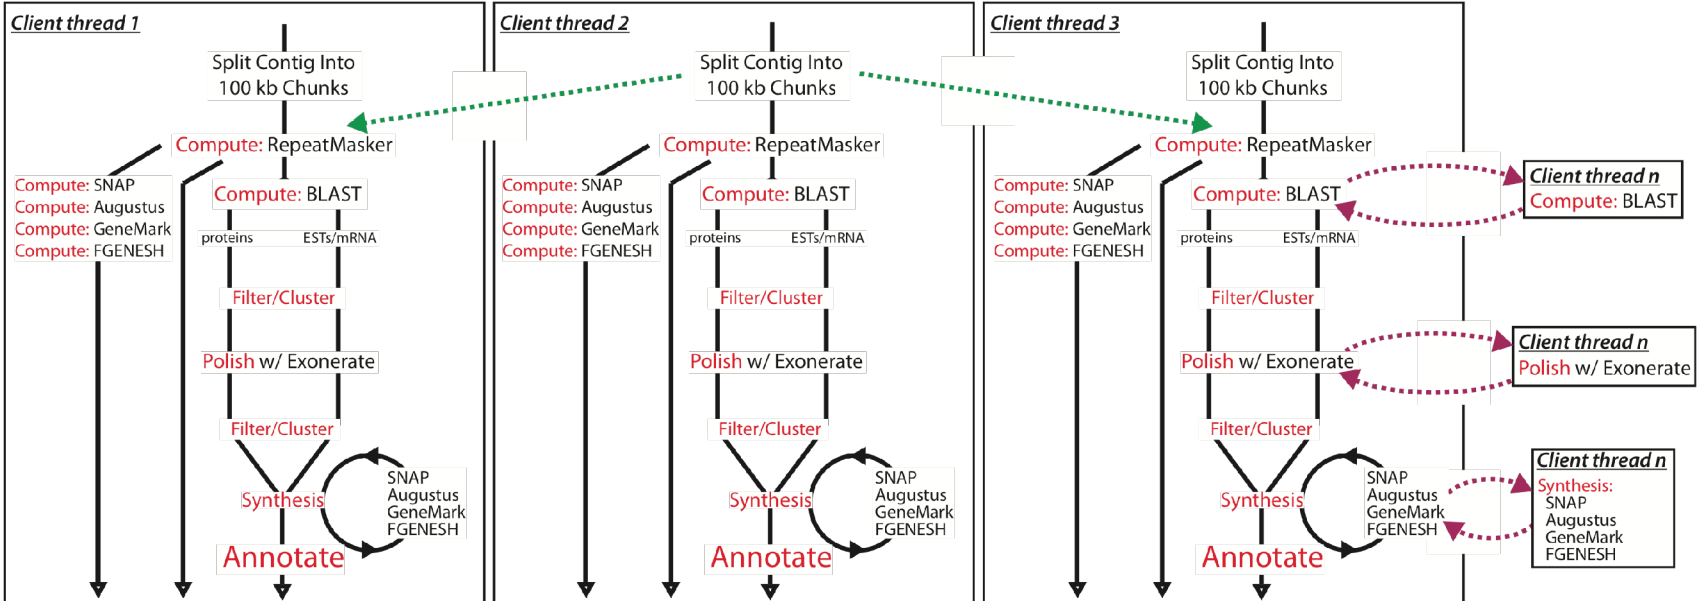

..... Contig level parallelization
 Parallelization by dividing sequence into chunks

- Contig level parallelization
- Parallelization by dividing sequence into chunks
- Parallelization by distributing datasets among threads

Data throughput

Proof-of-principle:

MAKER: Proof of Principle

Pythium ultimum var ultimum (potato rot)

Pinus taeda (loblolly pine) *BACs Only

Fusarium circinatum (pitch canker fungus)

Atta cephalotes (leaf-cutter ant)

Pogonomyrmex barbatus (red harvester ant)

Linepithema humile (Argentine ant)

Petromyzon marinus (lamprey)

Schmidtea mediterranea (flatworm)

MAKER is being used by over 700 other projects world wide

Fusarium circinatum

• Brenda Wingfield – University of Pretoria, South Africa

Fusarium circinatum

Atta Cephalotes

- Cameron Currie – University of Wisconsin-Madison

Pogonomyrmex barbatus

- Christopher D. Smith – San Francisco State University
- Christopher R. Smith – Earlham College
- Jürgen Gadau – Arizona State University
- Neil Tsutsui – University of California Berkeley

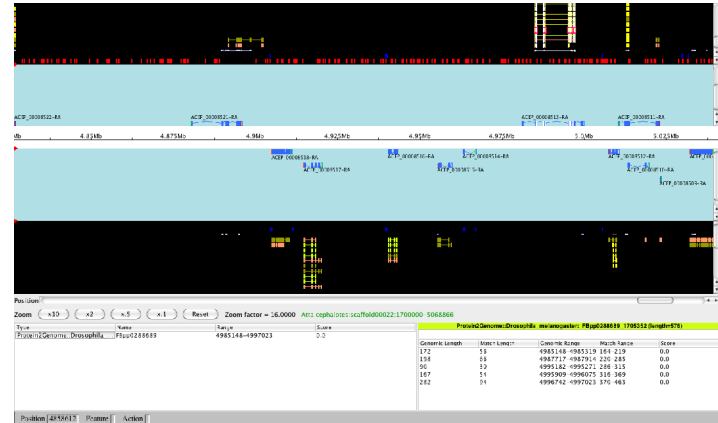

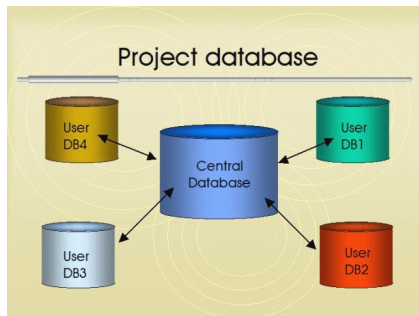

Linepithema humile

- Christopher D. Smith – San Francisco State University
- Christopher R. Smith – Earlham College
- Jürgen Gadau – Arizona State University
- Neil Tsutsui – University of California Berkeley

Pogonomyrmex barbatus, *Linepithema humile*, and *Atta cephalotes*

Community Annotation System (CAS)

Pogonomyrmex barbatus,
Linepithema humile, and
Atta cephalotes

– <http://hymenopteragenome.org/>

Conclusions

Towards a Turn-key Solution to Genome Annotation

- Easy-to-use
- Fully automated
- Structural and functional annotation
- *De novo* and re-annotation
- Data prioritization and database management
- Integrates with GMOD tools (Chado, Apollo, GBrowse, etc.)

Acknowledgements

- I'd like to thank and recognize all contributions from my former advisor Mark Yandell at the University of Utah, his lab members Barry Moore and Hao Hu. And I would like to thank his former lab members Brandi Cantarel and Hadi Islam for involvement in developing MAKER.
- I would also like to recognize collaborators Ian Korf at UC Davis and his lab member Genis Parra for their contributions.
- Special thank you to Dave Clements and Scott Cain for their contributions to MAKER via GMOD.
- Genome Project Collaborators:
 - Alejandro Sánchez Alvarado - University of Utah, HHMI
 - Robin Buell - Michigan State University
 - Weiming Li - Michigan State University
 - Makadonka Mitreva - Washington University
 - Allen Kovach - UC Davis
 - Brenda Wingfield – University of Pretoria, South Africa
 - Christopher D. Smith – San Francisco State University
 - Christopher R. Smith – Earlham College
 - Jürgen Gadau – Arizona State University
 - Neil Tsutsui – University of California Berkeley
 - Cameron Currie – University of Wisconsin-Madison
- Contributions in Testing and Development
 - Sánchez Alvarado lab, University of Utah - Sofia Robb and Eric Ross
 - Washington University Genome Sequencing Center - John Martin, Kimberlie Hallsworth, Asif Chinwalla, Christopher Schuster, Mark Johnson, and William Nash
- This project is supported by funding from the NHGRI through an RO1 grant entitled *Software for the creation and quality control of genome annotations*.
- This project is supported by an NIH Genetics Training Grant
